Semi-Supervised Locally Linear Embedding (SSLLE)

Application & Sensitivity Analysis of Critical Hyperparameters

0 AGENDA

- 1 Problem
- 2 Local graph-based manifold learning (LGML)
- 3 Techniques
 - 1 Unsupervised
 - 2 Semi-supervised SSLLE
 - 3 Challenges
- 4 Sensitivity analysis
 - 1 Setup
 - 2 Results
- 5 Discussion

1 PROBLEM MANIFOLD LEARNING

Situation. Rapidly increasing amount of data thanks to novel applications and data sources

Problem. High data dimensionality detrimental to

- → Model functionality
- \rightarrow Interpretability
- → Generalization ability

Manifold assumption. Data in high-dimensional observation space truly sampled from low-dimensional manifold

How to find a meaningful, structure-preserving embedding?

1 PROBLEM MANIFOLD LEARNING

Formal goal of manifold learning.

- ightarrow **Given.** Data $\mathcal{X}=(\mathbf{x}_1,\mathbf{x}_2,...,\mathbf{x}_N)$, with $\mathbf{x}_i\in\mathbb{R}^D\ \forall i\in\{1,2,...,N\}$ and $N,D\in\mathbb{N}$, supposedly lying on d-dimensional manifold \mathcal{M} $\Rightarrow \psi:\mathcal{M}\to\mathbb{R}^d$ with $d\ll D,d\in\mathbb{N}$ $\Rightarrow \mathcal{X}\sim\mathcal{M}\subset\mathbb{R}^D$
- ightarrow Goal. Find *d*-dimensional Euclidean representation $\Rightarrow \mathcal{Y} = (\mathbf{y_1}, \mathbf{y_2}, ..., \mathbf{y_N})$, with $\mathbf{y_i} = \psi(\mathbf{x_i}) \in \mathbb{R}^d \ \forall i \in \{1, 2, ..., N\}$.

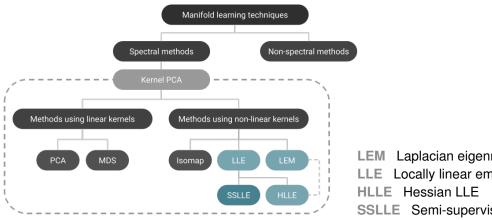

2 LGML

2 LGML TAXONOMY

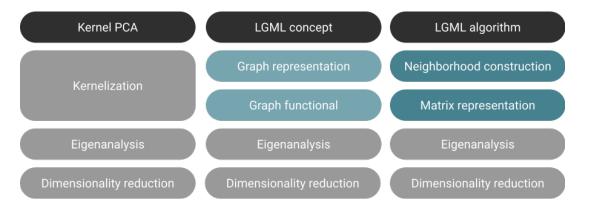

Landscape. Various approaches, many of which may be translated into one another

Laplacian eigenmaps Locally linear embedding SSLLE Semi-supervised LLE

2 LGML CONCEPT

Idea. Capture intrinsic geometry, find principal axes of variability, retain most salient ones

2 LGML CONCEPT

Graph representation. Constructing a skeletal model of the manifold in \mathbb{R}^D

Vertices. Given by observations **Edges.** Present between neighboring points

- \rightarrow Typically, k-neighborhoods
- → Edge weights determined by nearness

Graph functional. Belief about intrinsic manifold properties at the heart of each method

- ightarrow Smoothness LEM
- ightarrow Local linearity LLE SSLLE
- → Curviness HLLE
- ightarrow ...

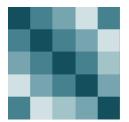

Achievements: non-linearity & locality

2 LGML CONCEPT

Eigenanalysis. Finding axes of variability in intrinsic manifold structure

- → Matrix representation of manifold properties
- ightarrow Assessment through eigenanalysis
 - \rightarrow Directions of variability \Rightarrow eigenvectors
 - → Respective degrees of variability ⇒ eigenvalues

Dimensionality reduction. Projection into subspace spanned by *d* principal eigenvectors

3 TECHNIQUES

3.1 UNSUPERVISED LEM

Proposal. Belkin and Niyogi (2001)

Idea. Forcing nearby inputs to be mapped to nearby outputs

- \rightarrow Notion of smoothness in mapping function
- \rightarrow Second-order penalty on gradient

Graph Laplacian. Discrete approximation of Laplace-Beltrami operator

- \rightarrow Weight matrix. $\mathbf{W} = (\mathbf{w})_{ij} \in \mathbb{R}^{N \times N}$, where $w_{ij} = w_{ij} (\|\mathbf{x}_i \mathbf{x}_i\|^2)$
- o Graph Laplacian. $extbf{\emph{L}} = extbf{\emph{D}} extbf{\emph{W}} \in \mathbb{R}^{N imes N}, extbf{\emph{D}} = diag(\sum_i w_{ii}) \in \mathbb{R}^{N imes N}$

Generalized eigenvalue problem.

$$\min_{\mathcal{Y}} trace(\mathcal{Y}^T \mathbf{L} \mathcal{Y}), \quad \text{s.t. } \mathcal{Y}^T \mathbf{D} \mathcal{Y} = \mathbf{I}$$
 (1)

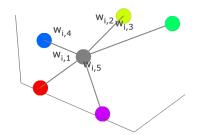

Solution: bottom d + 1 eigenvectors

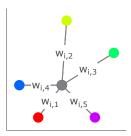

3.1 UNSUPERVISED LLE

Proposal. Roweis and Saul (2000)

Idea. Preserving locally linear reconstructions

- ightarrow Linear reconstruction of points in $\mathbb{R}^{\mathcal{D}}$ by their neighbors
- → Reconstruction weights = topological properties
- → Neighborhood patches invariant to dimensionality reduction

3.1 UNSUPERVISED LLE

Reconstruction loss minimization. Finding optimal reconstruction weights

$$\min_{\boldsymbol{W}} \varepsilon(\boldsymbol{W}) = \min_{\boldsymbol{W}} \sum_{i} \left\| \boldsymbol{x}_{i} - \sum_{i} w_{ij} \boldsymbol{x}_{j} \right\|^{2}, \quad \text{s.t. } \boldsymbol{1}^{T} \boldsymbol{w}_{i} = 1 \quad \forall i \in \{1, 2, ..., N\}$$
 (2)

Embedding loss minimization. Finding optimal embedding coordinates

$$\min_{\mathcal{Y}} \Phi(\mathcal{Y}) = \min_{\mathcal{Y}} \sum_{i} \left\| \mathbf{y}_{i} - \sum_{i} w_{ij} \mathbf{y}_{i} \right\|^{2}, \quad \text{s.t. } \frac{1}{N} \sum_{i} \mathbf{y}_{i} \mathbf{y}_{i}^{T} = \mathbf{I}, \quad \sum_{i} \mathbf{y}_{i} = \mathbf{0} \quad \forall i \in \{1, 2, ..., N\}$$
(3)

Eigenvalue problem. Define $\mathbf{E} = (\mathbf{I} - \mathbf{W})^T (\mathbf{I} - \mathbf{W})$, such that

$$\min_{\mathcal{Y}} trace(\mathcal{Y}^{\mathsf{T}} \mathbf{E} \mathcal{Y}), \quad \text{s.t. } \frac{1}{\mathsf{N}} \mathcal{Y}^{\mathsf{T}} \mathcal{Y} = \mathbf{I}, \quad \mathcal{Y}^{\mathsf{T}} \mathbf{1} = \mathbf{0}. \tag{4}$$

Solution: bottom d+1 eigenvectors

3.1 UNSUPERVISED HLLE

Proposal. Donoho and Grimes (2003)

Idea. Finding a truly locally linear mapping while preserving local isometry

- ightarrow Second-order penalty on Hessian
- ightarrow Strong convergence guarantees but rather complex computations

Hessian functional. Measuring average curviness over \mathcal{M}

- o Continuous functional. $\mathscr{H}(f) = \int_{\mathcal{M}} \left\| m{H}_f^{ ext{loc}}(m{p})
 ight\|_F^2 dm{p}$
- ightarrow Hessian estimators $extbf{ extit{H}}_\ell$ derived from locally linear neighborhood patches
- ightarrow Empirical approximator. $\mathcal{H}_{ij} = \sum_{\ell} \sum_{m} (\mathbf{H}_{\ell})_{m,i} (\mathbf{H}_{\ell})_{m,j}$
- ightarrow Finding null space of ${\cal H}$

Solution: bottom d + 1 eigenvectors + scaling

Proposal. Yang et al. (2006)

Problem. Embedding found by unsupervised methods not always meaningful

Idea. Improving LLE by use of prior knowledge

Semi-supervision. Anchoring embedding at some prior points with known coordinates

- → More active than semi-supervised learning?
- \rightarrow Setting. Information available or to be obtained by querying the oracle
- \rightarrow Goal. Maximum information at little expense \Rightarrow careful choice of prior points

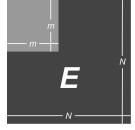

Types of prior information. Exact vs inexact

ightarrow Level of confidence encoded in parameter eta

Algorithmic impact. Recall LLE eigenvalue problem

$$\min_{\mathcal{Y}} trace(\mathcal{Y}^T \mathbf{E} \mathcal{Y}), \quad \text{s.t. } \frac{1}{N} \mathcal{Y}^T \mathcal{Y} = \mathbf{I}, \quad \mathcal{Y}^T \mathbf{1} = \mathbf{0}.$$

 \Rightarrow Partitioning of $\emph{\textbf{E}}$ and ${\mathcal Y}$

Modified optimization problem. Exact information

$$\min_{\mathcal{Y}_2} \begin{bmatrix} \mathcal{Y}_1 & \mathcal{Y}_2 \end{bmatrix} \begin{bmatrix} M_{11} & M_{12} \\ M_{21} & M_{22} \end{bmatrix} \begin{bmatrix} \mathcal{Y}_1^T \\ \mathcal{Y}_2^T \end{bmatrix}$$
(5)

$$\Leftrightarrow \mathcal{Y}_2^T = M_{22}^{-1} M_{12} \mathcal{Y}_1^T \tag{6}$$

Modified optimization problem. Inexact information

$$\min_{\mathcal{Y}} \begin{bmatrix} \mathcal{Y}_1 & \mathcal{Y}_2 \end{bmatrix} \begin{bmatrix} M_{11} & M_{12} \\ M_{21} & M_{22} \end{bmatrix} \begin{bmatrix} \mathcal{Y}_1^T \\ \mathcal{Y}_2^T \end{bmatrix} + \beta \left\| \mathcal{Y}_1^T - \hat{\mathcal{Y}}_1^T \right\|_F^2$$
(7)

$$\Leftrightarrow \begin{bmatrix} M_{11} + \beta \mathbf{I} & M_{12} \\ M_{21} & M_{22} \end{bmatrix} \begin{bmatrix} \mathcal{Y}_1^T \\ \mathcal{Y}_2^T \end{bmatrix} = \begin{bmatrix} \hat{\mathcal{Y}}_1^T \\ \mathbf{0} \end{bmatrix}$$
 (8)

Choice of landmark points. Basically, three options

- \rightarrow Pre-existing prior information \Rightarrow worst case: poor coverage
- → Random sampling
- ightarrow Maximum coverage

Maximum coverage. Points scattered across manifold surface

- ightarrow Goodness of solution depending on condition number $\kappa(\textit{M}_{22})$
- $\rightarrow \kappa(M_{22})$ minimal at maximization of minimum pairwise distances between prior points

3.3 CHALLENGES CRITICAL PARAMETERS

Intrinsic dimensionality. True sources of variability

→ Considered known with availability of prior information

Neighborhood size. Global vs local structure

 \rightarrow Tunable (expensive)

Regularization constant. Singularity for D < k

→ Heuristics

Number & location of prior points. Utility of prior knowledge

ANALYSIS

→ Exploration vs labeling cost

Noise level. Quality of prior knowledge ANALYSIS

→ How exact must prior information be?

Confidence parameter. Strength of belief in prior knowledge

→ Rather robust

4 SENSITIVITY ANALYSIS

4.1 SETUP DATA

Data. Two data sets, N = 1000 observations each

Swiss roll. The standard synthetic manifold

1 Sample
$$u_1, u_2 \sim U(0, 1)$$
 iid with $|u_1| = |u_1| = N$

2 Compute
$$t = 1.5\pi(1 + 2u_1)$$

3 Set
$$\mathcal{X}_{swiss} = \begin{bmatrix} t \cos t & 21 u_2 & t \sin t \end{bmatrix}$$

Incomplete tire. Examined in Yang et al. (2006)

- 1 Sample $u_1, u_2 \sim U(0, 1)$ iid with $|u_1| = |u_1| = N$
- 2 Compute $\mathbf{t} = \frac{5\pi}{3} \mathbf{u}_1$ and $\mathbf{s} = \frac{5\pi}{3} \mathbf{u}_2$
- 3 Set $\mathcal{X}_{tire} = [(3 + \cos s) \cos t \quad (3 + \cos s) \sin t \quad \sin s]$

4.1 SETUP SCENARIOS

Sensitivity analysis I. Landmark coverage \times number of landmark points

- \rightarrow Landmark coverage \in {poor, random, maximum}
- \rightarrow Number of landmark points $\in \{2, 4, 6, 8, 10, 12\}$
- ⇒ Best case: maximum coverage & 12 landmarks

Sensitivity analysis II. Noise level \times number of landmark points

- → Simulation of inexact prior information through perturbation with Gaussian noise
- \rightarrow Noise level ∈ {0.1, 0.5, 1, 3, 5} \Rightarrow standard deviation
- \rightarrow Number of landmark points $\in \{2, 4, 6, 8, 10, 12\}$
- ⇒ Best case: noise level 0.1 & 12 landmarks

4.1 SETUP EVALUATION

Evaluation criterion I. Residual variance

ightarrow foo

Evaluation criterion II. Area under the xy curve

ightarrow foo

⇒ Both semi-reliable

⇒ Additional visual inspection
